OpenSeminar is an open courseware platform that enables professors to work collaboratively to create an online seminar and then customize it to the needs of their students.

Content is organized into a hierarchical Wiki-like collection of modules, collaboratively maintained by a group of professors.

Links to external articles, lectures, and sites are organized into the module framework, allowing diverse and comprehensive coverage of a subject area.

Professors schedule a collection of modules and links to create a course customized to the specific needs of their students.
