Improving Fingerprint Sensor Interoperability using Sensor Agnostic Image Transformation

S.K. Modi, Ph.D., A. Mohan, Prof. S.J. Elliott, Ph.D.

Biometric Standards, Performance and Assurance Laboratory, Department of Industrial Technology

Motivation

- Sensor technologies introduced their own distortions and variations in the fingerprint image
- Matching fingerprints collected from different sensor technologies increases error rates
- Goal is find a sensor agnostic method of normalizing image

Fingerprint Data

- Fingerprints collected from 190 subjects using 9 different fingerprint sensors

Thermal Optical Capacitive

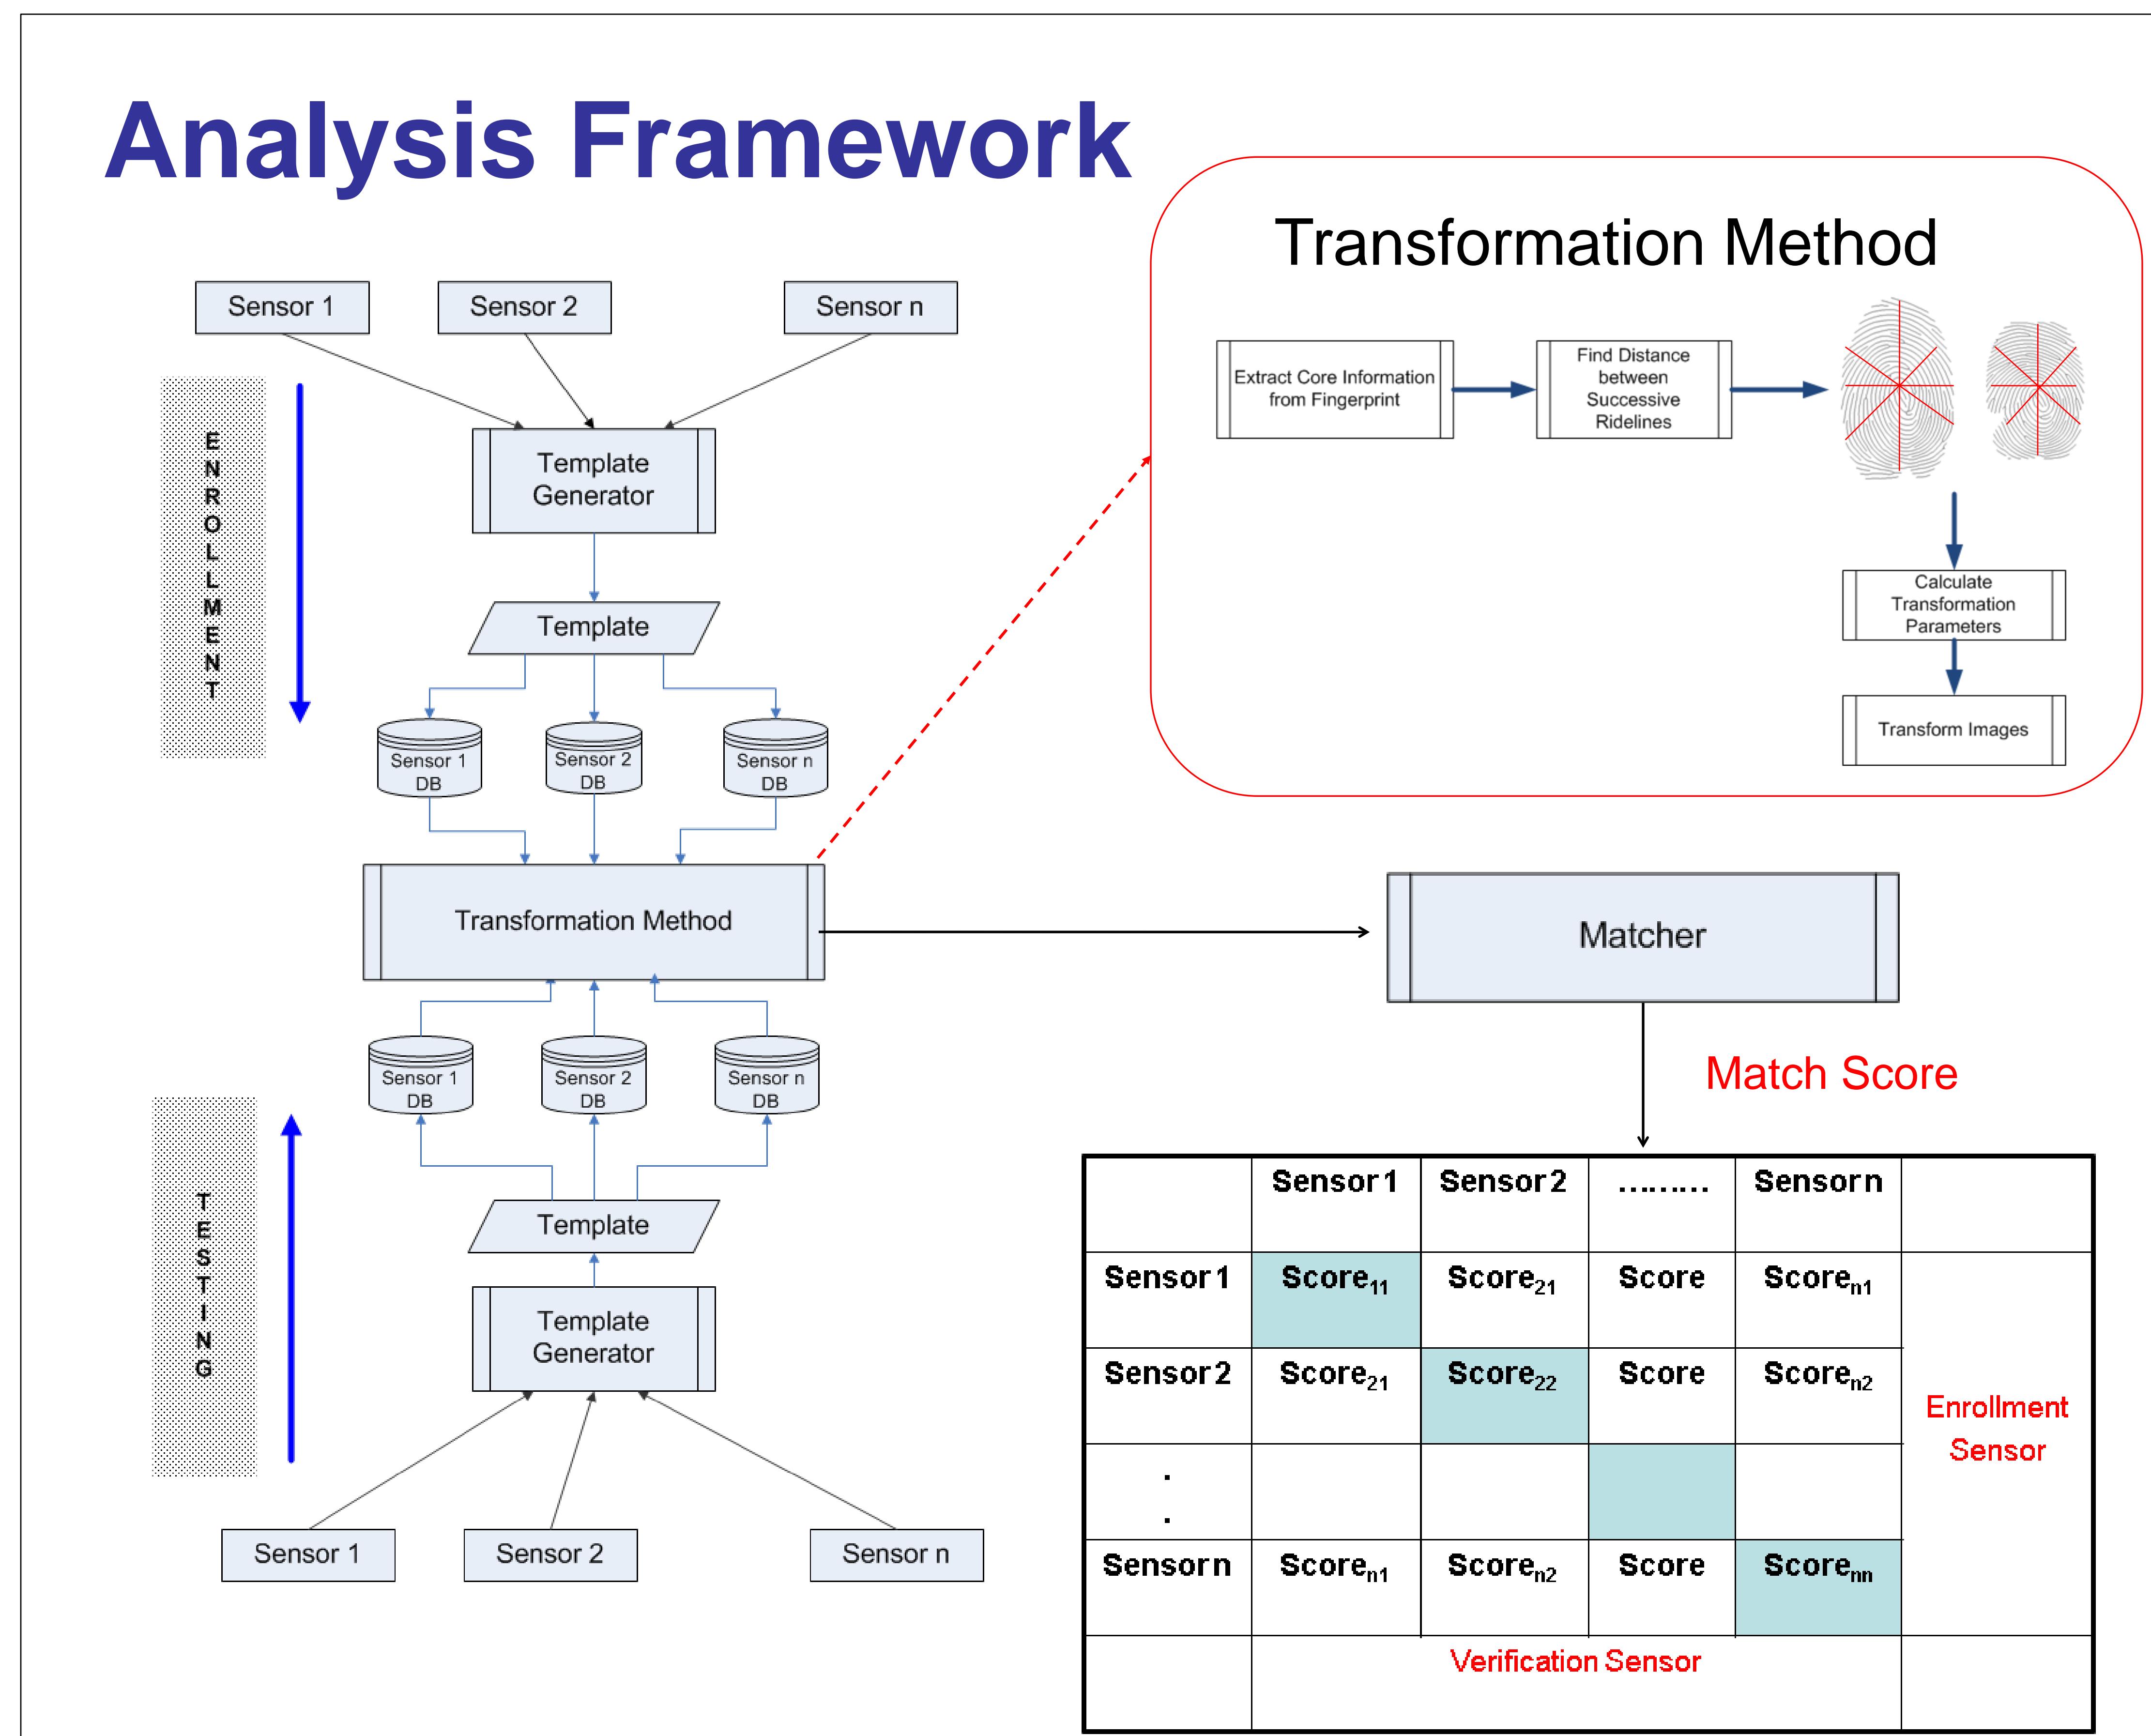

Original Results

- False Reject Rates for comparison using original non-normalized fingerprints

	TEST

	S9	2.87	2.96	0.12	0.90	0.49	1.73	0.77	0.11

Analysis Framework

Future Work

- Generate performance results for transformed fingerprint images
- Calculate linear transformation parameters and polynomial transformation parameters
- Explore methods for normalizing non-linear distortion at the edges of fingerprint images
